

Chapter 7

Advanced Encryption Standard (AES)

Chapter 7

Objectives

- ❑ To review a short history of AES
- ❑ To define the basic structure of AES
- ❑ To define the transformations used by AES
- ❑ To define the key expansion process
- ❑ To discuss different implementations

7-1 INTRODUCTION

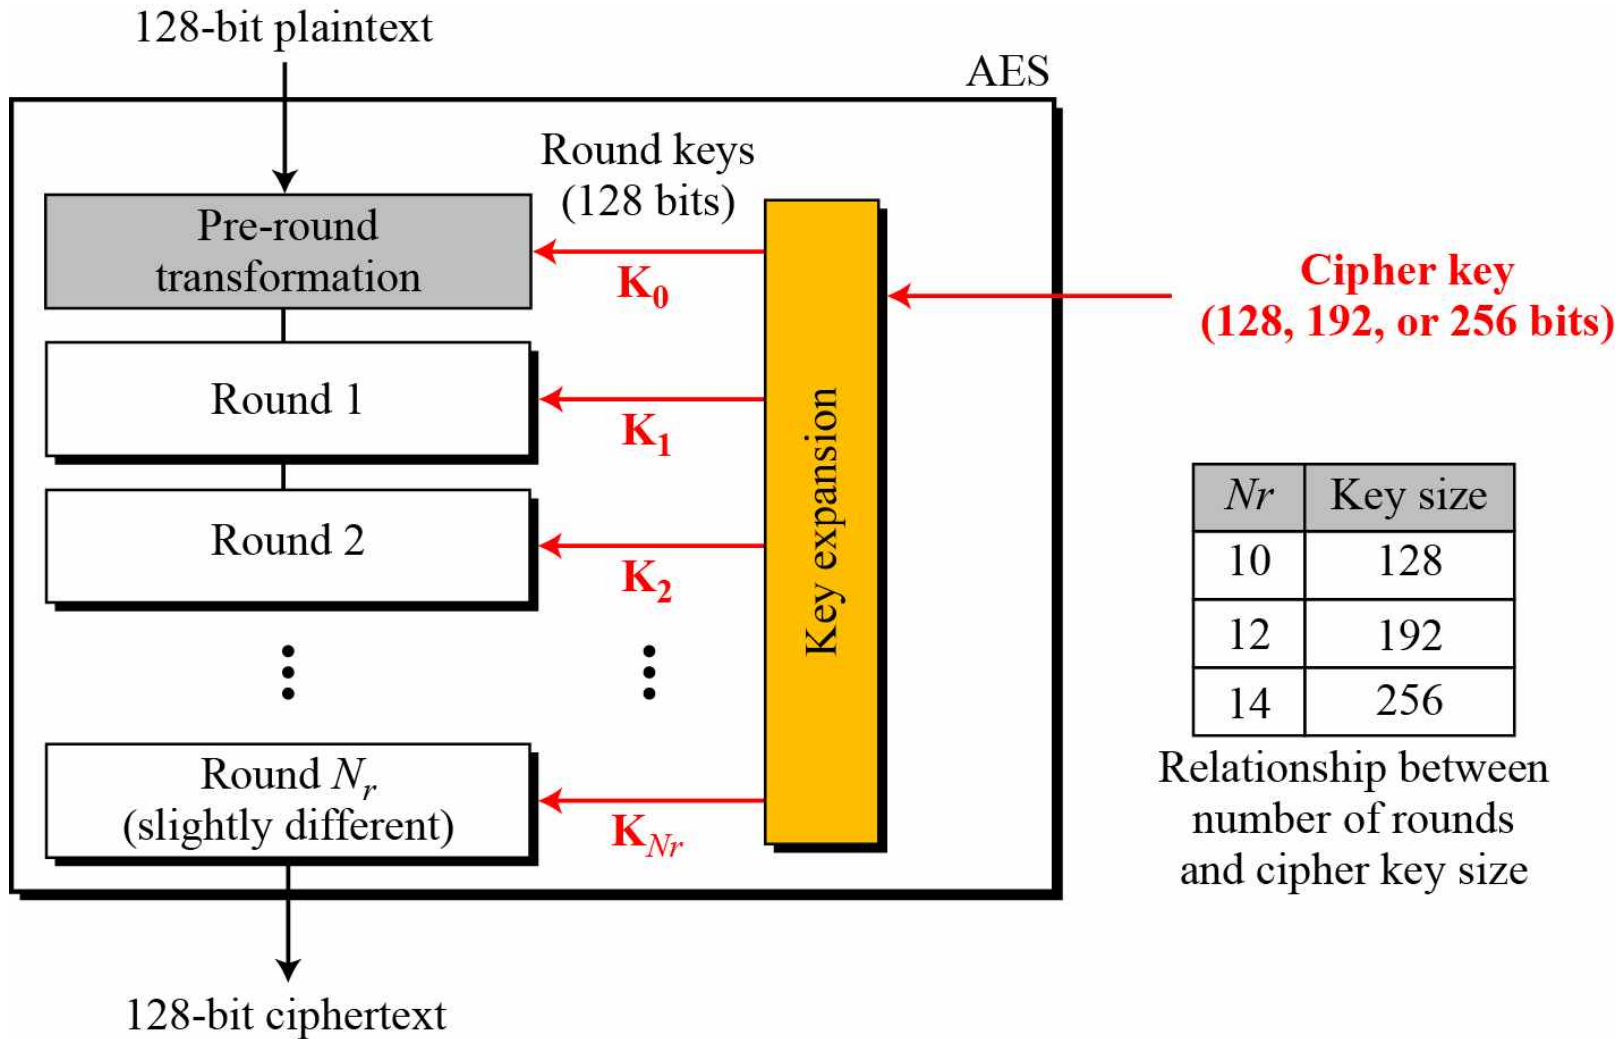

The Advanced Encryption Standard (AES) is a symmetric-key block cipher published as **FIPS 197** by the National Institute of Standards and Technology in December 2001.

Candidates : 21 > 15 > 5 > 1 (**Rijndael**: security, cost, implementation)

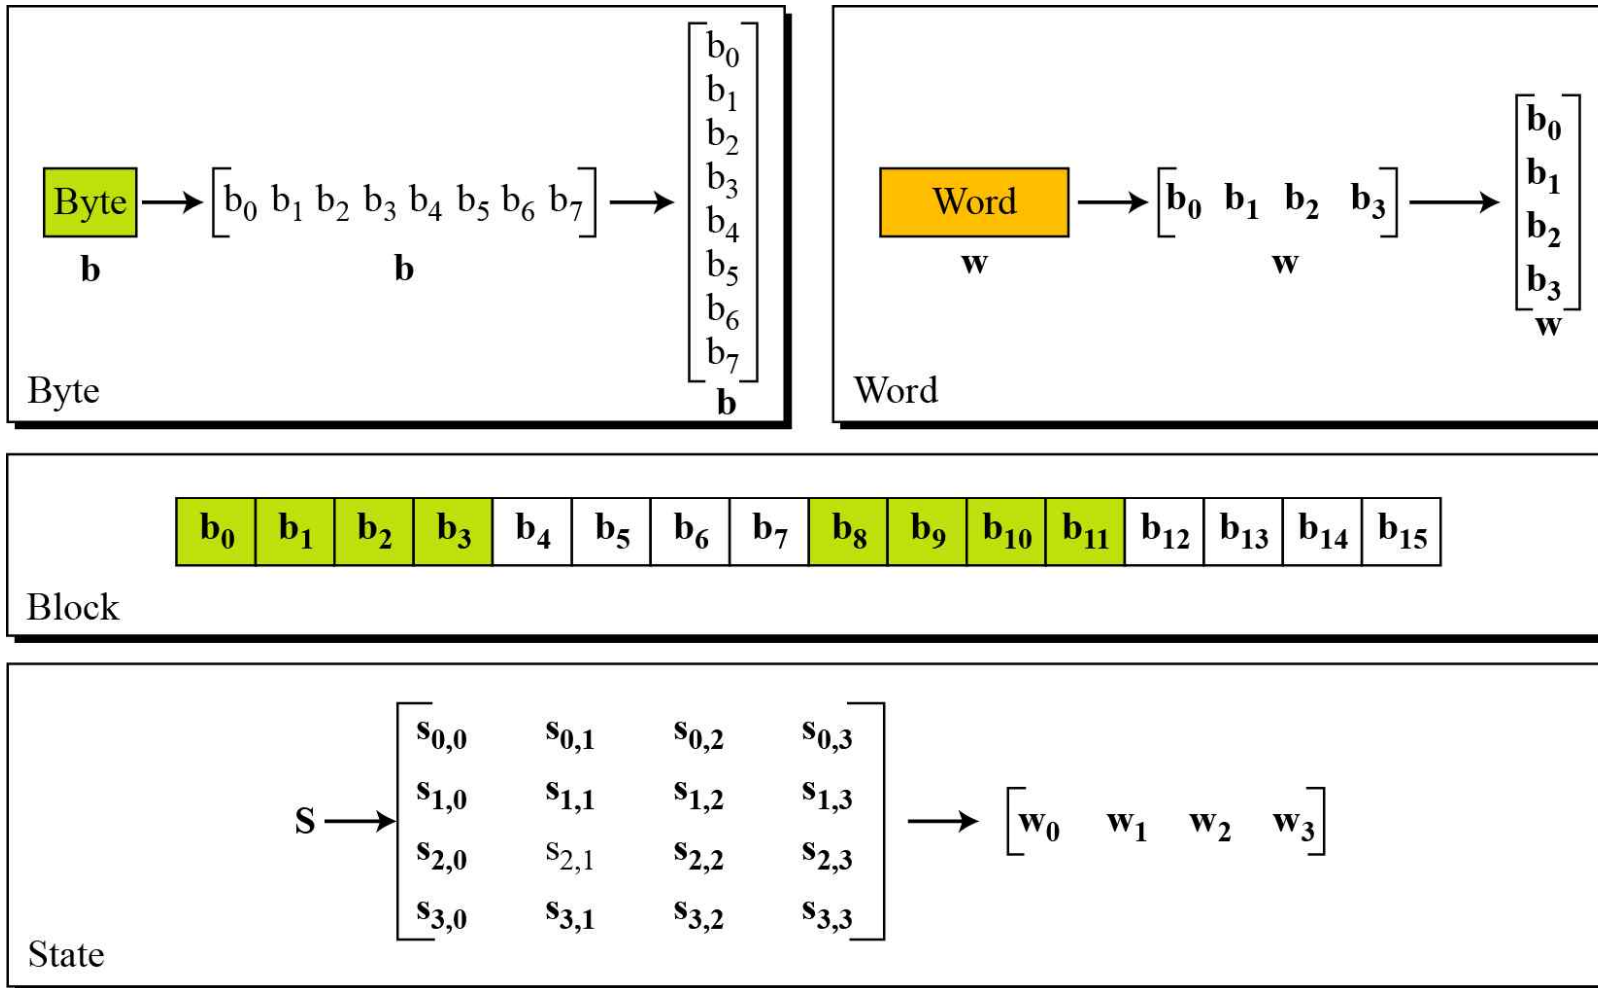

AES has defined three versions, with 10, 12, and 14 rounds.

Each version uses a different cipher key size (128, 192, or 256), but the round keys are always 128 bits.

7.1.5 Structure of Each Round

7-2 TRANSFORMATIONS

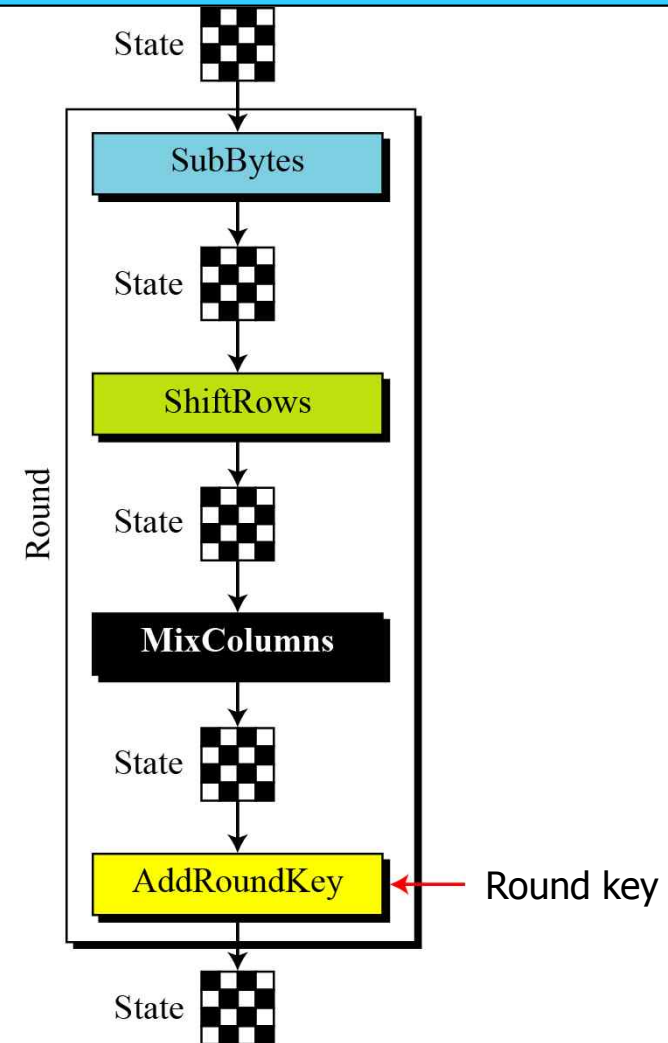

To provide security, AES uses **four types of transformations**:

Substitution

Permutation

Mixing

key-adding

7.2.1 Substitution

SubBytes

The first transformation, SubBytes, is used at the encryption site. To substitute a byte, we interpret the byte as two hexadecimal digits.

The SubBytes operation involves 16 independent byte-to-byte transformations.

7.2.1 Continue

7.2.1 *Continue*

Example 7.2

Figure 7.7 shows how a state is transformed using the SubBytes transformation. The figure also shows that the InvSubBytes transformation creates the original one. Note that if the two bytes have the same values, their transformation is also the same.

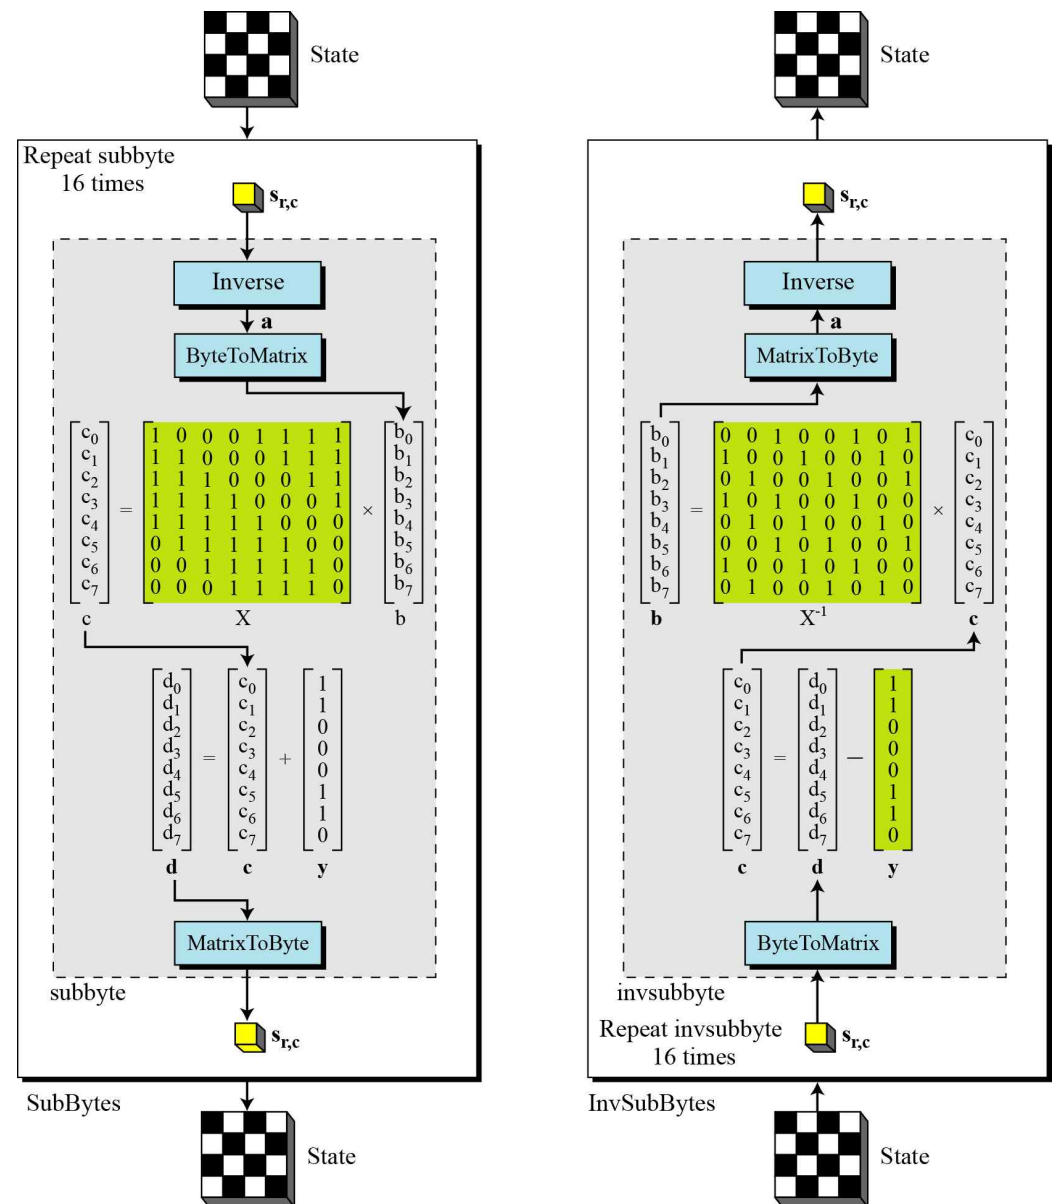

$$\text{subbyte:} \rightarrow \mathbf{d} = \mathbf{X} (s_{r,c})^{-1} \oplus \mathbf{y}$$

$$\text{invsubbyte:} \rightarrow [\mathbf{X}^{-1}(\mathbf{d} \oplus \mathbf{y})]^{-1} = [\mathbf{X}^{-1}(\mathbf{X} (s_{r,c})^{-1} \oplus \mathbf{y} \oplus \mathbf{y})]^{-1} = [(s_{r,c})^{-1}]^{-1} = s_{r,c}$$

Transformation Using the GF(2⁸) Field

AES also defines the transformation algebraically using the GF(2⁸) field with the irreducible polynomials

$$(x^8 + x^4 + x^3 + x + 1)$$

7.2.1 *Continue*

Example 7.3

Let us show how the byte 0C is transformed to FE by subbyte routine and transformed back to 0C by the invsubbyte routine.

1. *subbyte*:
 - a. The multiplicative inverse of 0C in $GF(2^8)$ field is B0, which means **b** is (10110000).
 - b. Multiplying matrix **X** by this matrix results in **c** = (10011101)
 - c. The result of XOR operation is **d** = (11111110), which is FE in hexadecimal.
2. *invsubbyte*:
 - a. The result of XOR operation is **c** = (10011101)
 - b. The result of multiplying by matrix \mathbf{X}^{-1} is (11010000) or B0
 - c. The multiplicative inverse of B0 is 0C.

7.2.2 *Permutation*

Another transformation found in a round is shifting, which permutes the bytes.

ShiftRows

In the encryption, the transformation is called ShiftRows.

InvShiftRows

In the decryption, the transformation is called InvShiftRows and the shifting is to the right.

7.2.2 Continue

Example 7.4

Figure 7.10 shows how a state is transformed using ShiftRows transformation. The figure also shows that InvShiftRows transformation creates the original state.

7.2.3 Mixing

We need to mix bytes to provide diffusion at the bit level.

Figure 7.11 Mixing bytes using matrix multiplication

$$\begin{array}{l}
 ax + by + cz + dt \\
 ex + fy + gz + ht \\
 ix + jy + kz + lt \\
 mx + ny + oz + pt
 \end{array}
 \begin{array}{c}
 \rightarrow \\
 \rightarrow \\
 \rightarrow \\

 09 & 0E & 0B & 0D \\
 0D & 09 & 0E & 0B \\
 0B & 0D & 09 & 0E
 \end{bmatrix} \\
 \mathbf{C} \qquad \qquad \qquad \mathbf{C}^{-1}
 \end{array}$$

7.2.3 *Continue*

MixColumns

The MixColumns transformation operates at the column level; it transforms each column of the state to a new column.

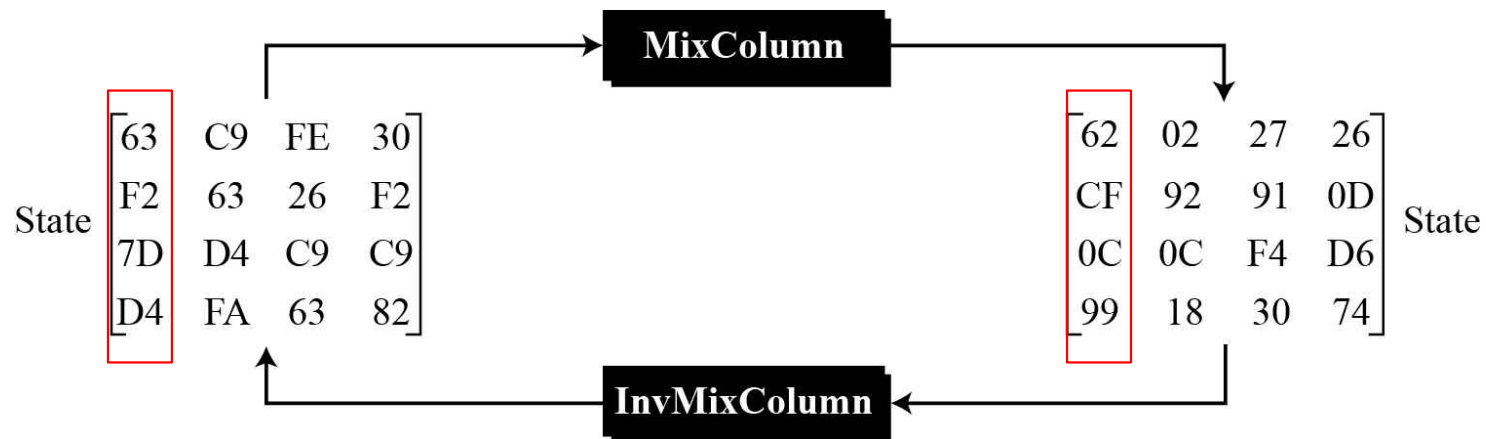

InvMixColumns

The InvMixColumns transformation is basically the same as the MixColumns transformation.

7.2.3 Continue

Example 7.5

Figure 7.14 shows how a state is transformed using the MixColumns transformation. The figure also shows that the InvMixColumns transformation creates the original one.

$$\begin{bmatrix} 02 & 03 & 01 & 01 \\ 01 & 02 & 03 & 01 \\ 01 & 01 & 02 & 03 \\ 03 & 01 & 01 & 02 \end{bmatrix} \cdot \begin{bmatrix} 63 \\ F2 \\ 7D \\ D4 \end{bmatrix} = \begin{bmatrix} 62 \\ CF \\ 0C \\ 99 \end{bmatrix}$$

7.2.4 Key Adding

AddRoundKey

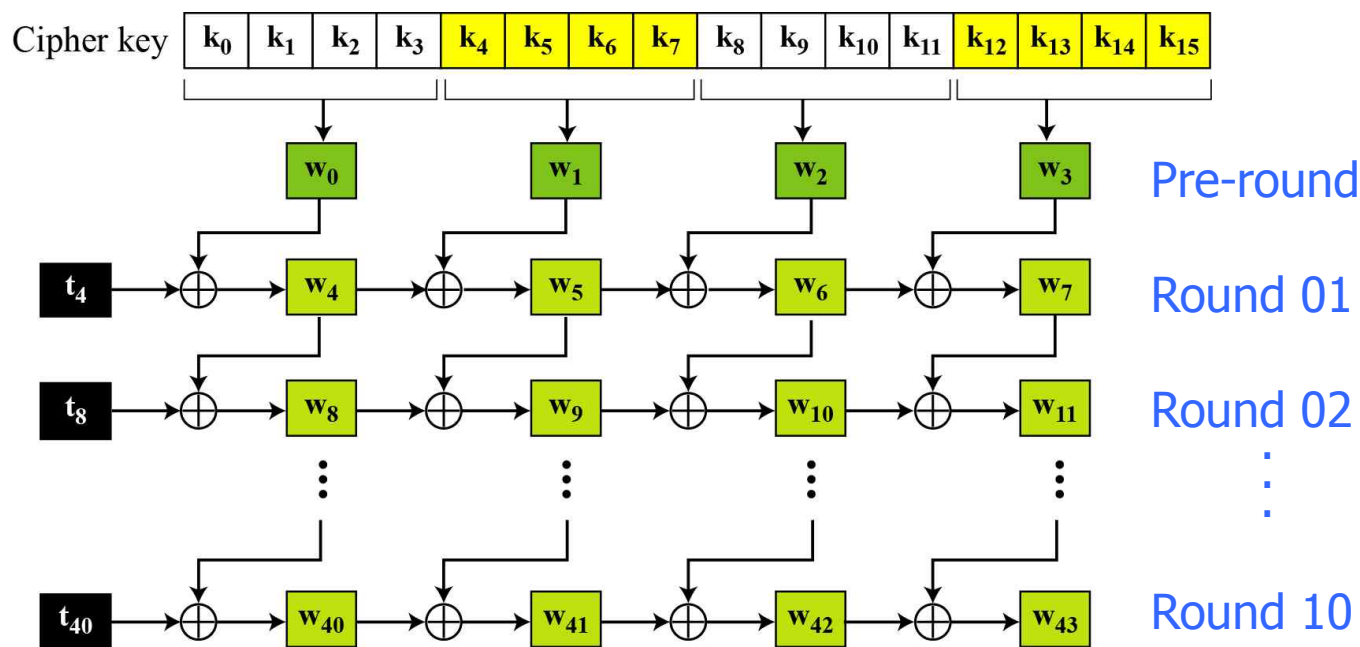

AddRoundKey proceeds one column at a time. AddRoundKey adds a round key word with each state column matrix.

7-3 KEY EXPANSION

To create round keys for each round, AES uses a key-expansion process. If the number of rounds is N_r , the key-expansion routine creates $N_r + 1$ 128-bit round keys from one single 128-bit cipher key.

7.3.1 Key Expansion in AES-128

Making of t_i (temporary) words $i = 4 N_r$

Table 7.4 *RCon constants*

Round	Constant (RCon)	Round	Constant (RCon)
1	(<u>01</u> 00 00 00) ₁₆	6	(<u>20</u> 00 00 00) ₁₆
2	(<u>02</u> 00 00 00) ₁₆	7	(<u>40</u> 00 00 00) ₁₆
3	(<u>04</u> 00 00 00) ₁₆	8	(<u>80</u> 00 00 00) ₁₆
4	(<u>08</u> 00 00 00) ₁₆	9	(<u>1B</u> 00 00 00) ₁₆
5	(<u>10</u> 00 00 00) ₁₆	10	(<u>36</u> 00 00 00) ₁₆

7.3.1 Continue

Example 7.6

Table 7.5 shows how the keys for each round are calculated assuming that the 128-bit cipher key agreed upon by Alice and Bob is (24 75 A2 B3 34 75 56 88 31 E2 12 00 13 AA 54 87)₁₆.

Table 7.5 Key expansion example

7.3.1 *Continue*

Example 7.7

Each round key in AES depends on the previous round key. The dependency, however, is **nonlinear** because of SubWord transformation. The addition of the round constants also guarantees that each round key will be different from the previous one.

7.3.1 Continue

Example 7.8

The two sets of round keys can be created from two cipher keys that are different only in one bit.

Cipher Key 1: 12 45 A2 A1 23 31 A4 A3 B2 CC AA 34 C2 BB 77 23
 Cipher Key 2: 12 45 A2 A1 23 31 A4 A3 B2 CC AB 34 C2 BB 77 23

Table 7.6 Comparing two sets of round keys

10	83AD32C8 FD460330 C5547A26 D216F613	E83BDAB0 FDD00348 A0A90064 D2EBF651	52

7.3.1 Continue

Example 7.9

The concept of **weak keys**, as we discussed for DES in Chapter 6, does not apply to AES. Assume that **all bits in the cipher key are 0s**. The following shows the words for some rounds:

Pre-round:	00000000	00000000	00000000	00000000
Round 01:	62636363	62636363	62636363	62636363
Round 02:	9B9898C9	F9FBFBAA	9B9898C9	F9FBFBAA
Round 03:	90973450	696CCFFA	F2F45733	0B0FAC99
...
Round 10:	B4EF5BCB	3E92E211	23E951CF	6F8F188E

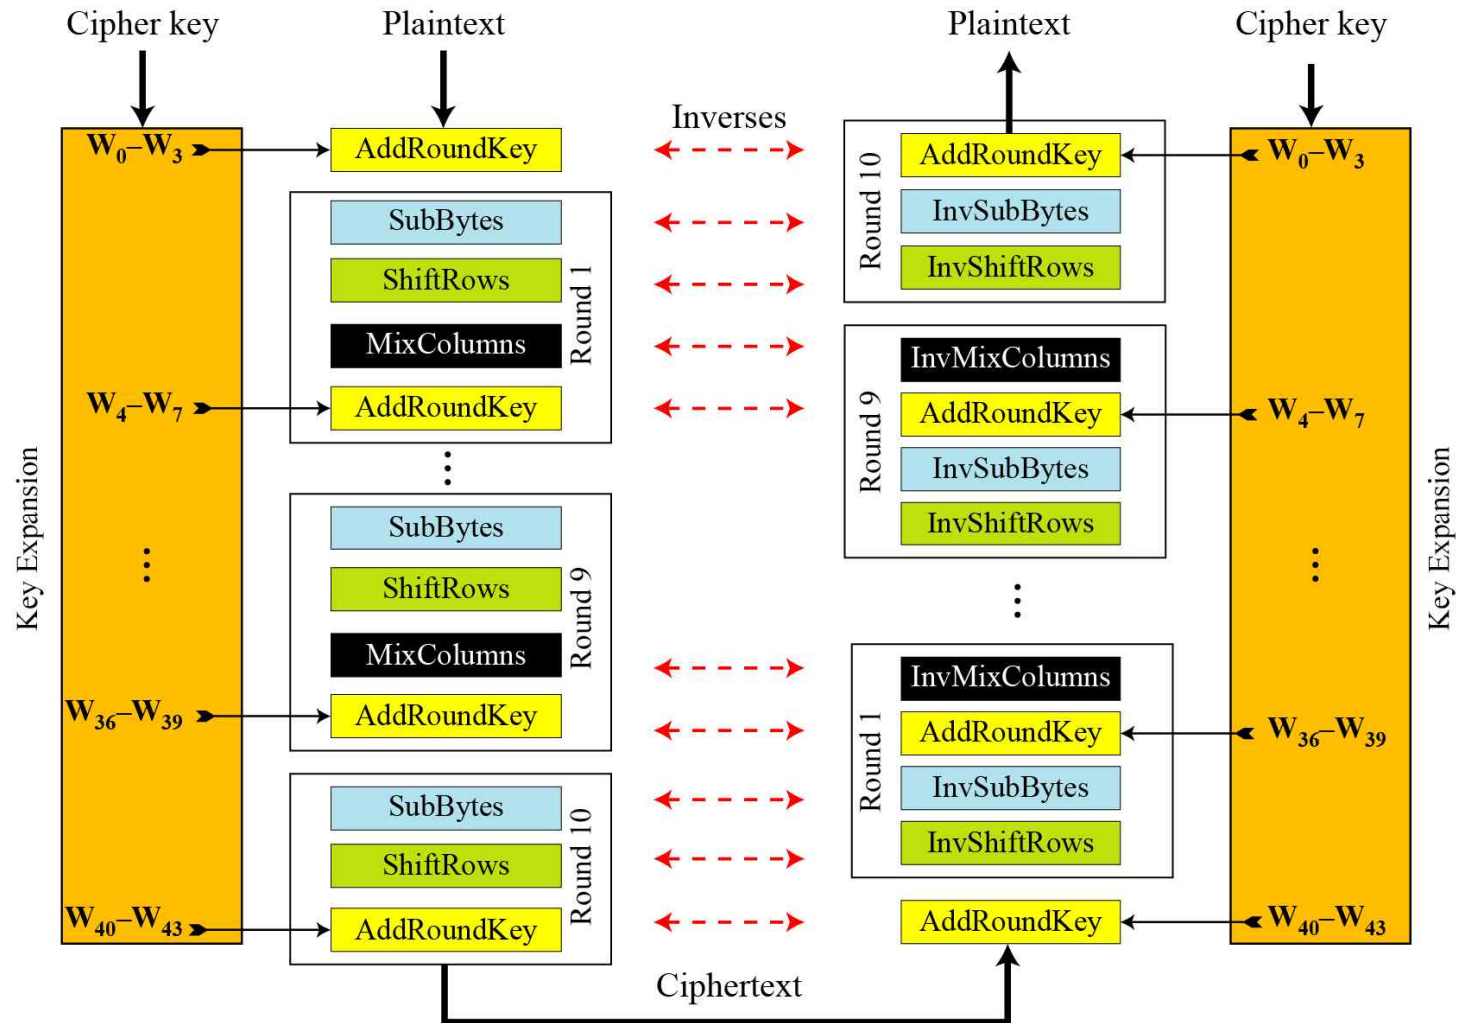

The words in the pre-round and the first round are all the same. In the second round, the first word matches with the third; the second word matches with the fourth. However, after the second round the pattern disappears; **every word is different**.

7-4 CIPHERS

AES uses four types of transformations for encryption and decryption. In the standard, the encryption algorithm is referred to as the cipher and the decryption algorithm as the inverse cipher.

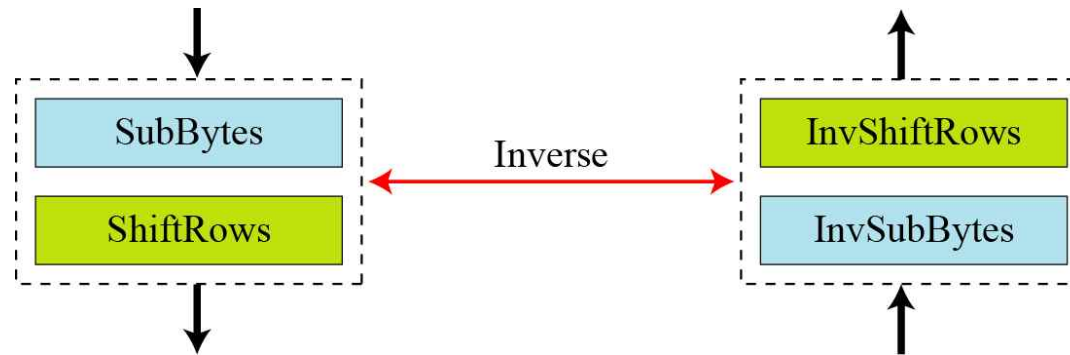

7.4.1 Original Design

7-6 ANALYSIS OF AES

7.6.1 Security

AES was designed after DES. Most of the known attacks on DES were already tested on AES.

Brute-Force Attack

AES is definitely more secure than DES due to the larger-size key.

Statistical Attacks

Numerous tests have failed to do statistical analysis of the ciphertext.

Differential and Linear Attacks

There are no differential and linear attacks on AES as yet.

7.6.2 Implementation

AES can be implemented in software, hardware, and firmware. The implementation can use table lookup process or routines that use a well-defined algebraic structure.

7.6.3 Simplicity and Cost

The algorithms used in AES are so simple that they can be easily implemented using cheap processors and a minimum amount of memory.

Assignment 6, Canceled.

- Problems 17, 18, 23, 24, 26, 33 in chapter 7
- Problems 3~7 in chapter 8
